

CMSC 330: Organization of Programming Languages

Regular Expressions and Finite Automata

CMSC 330 Spring 2024

1

1

How do regular expressions work?

- ▶ What we've learned
 - What regular expressions are
 - What they can express, and cannot
 - Programming with them
- ▶ What's next: how they work
 - A great computer science result

CMSC 330 Spring 2024

2

2

Languages and Machines

A formal language is a set of strings of symbols drawn from a finite alphabet.

- Can be specified either by
- a set of rules (such as regular expressions or a CFG) that generates the language
 - a formal machine that accepts (recognizes) the language.

CMSC 330 Spring 2024

3

3

A Few Questions About REs

- ▶ How are REs implemented?
 - Given an arbitrary RE and a string, how to decide whether the RE matches the string?
- ▶ What are the basic components of REs?
 - Can implement some features in terms of others
 - E.g., e^+ is the same as ee^*
- ▶ What does a regular expression represent?
 - Just a set of strings
 - This observation provides insight on how we go about our implementation

CMSC 330 Spring 2024

4

4

Definition: Alphabet

- ▶ An **alphabet** is a finite set of symbols
 - Usually denoted Σ
- ▶ Example alphabets:
 - Binary: $\Sigma = \{0,1\}$
 - Decimal: $\Sigma = \{0,1,2,3,4,5,6,7,8,9\}$
 - Alphanumeric: $\Sigma = \{0-9,a-z,A-Z\}$

CMSC 330 Spring 2024

5

5

Definition: String

- ▶ A **string** is a finite sequence of symbols from Σ
 - ϵ is the empty string (" in Ruby)
 - $|s|$ is the length of string s
 - $|\text{Hello}| = 5$, $|\epsilon| = 0$
 - Note
 - \emptyset is the empty set (with 0 elements)
 - $\emptyset \neq \{\epsilon\}$ (and $\emptyset \neq \epsilon$)
- ▶ Example strings over alphabet $\Sigma = \{0,1\}$ (binary):
 - 0101
 - 0101110
 - ϵ

CMSC 330 Spring 2024

6

6

Definition: Language

- ▶ A **language** L is a set of strings over an alphabet
- ▶ Example: All strings of length 1 or 2 over alphabet $\Sigma = \{a, b, c\}$ that begin with a
 - $L = \{a, aa, ab, ac\}$
- ▶ Example: All strings over $\Sigma = \{a, b\}$
 - $L = \{\epsilon, a, b, aa, bb, ab, ba, aaa, bba, aba, baa, \dots\}$
 - Language of all strings written Σ^*
- ▶ Example: All strings of length 0 over alphabet Σ
 - $L = \{s \mid s \in \Sigma^* \text{ and } |s| = 0\}$
 - "the set of strings s such that s is from Σ^* and has length 0"
 - $= \{\epsilon\} \neq \emptyset$

CMSC 330 Spring 2024

7

7

Definition: Language (cont.)

- ▶ Example: The set of phone numbers over the alphabet $\Sigma = \{0, 1, 2, 3, 4, 5, 6, 7, 9, (,), -\}$
 - Give an example element of this language (123) 456-7890
 - Are all strings over the alphabet in the language? No
 - Is there a regular expression for this language?
 $\backslash(\backslash d\{3\}\backslash)\backslash d\{3\}-\backslash d\{4\}$
- ▶ Example: The set of all valid (runnable) OCaml programs
 - Later we'll see how we can specify this language
 - (Regular expressions are useful, but not sufficient)

CMSC 330 Spring 2024

8

8

Operations on Languages

- ▶ Let Σ be an alphabet and let L, L_1, L_2 be languages over Σ
- ▶ **Concatenation** L_1L_2 creates a language defined as
 - $L_1L_2 = \{xy \mid x \in L_1 \text{ and } y \in L_2\}$
- ▶ **Union** creates a language defined as
 - $L_1 \cup L_2 = \{x \mid x \in L_1 \text{ or } x \in L_2\}$
- ▶ **Kleene closure** creates a language is defined as
 - $L^* = \{x \mid x = \epsilon \text{ or } x \in L \text{ or } x \in LL \text{ or } x \in LLL \text{ or } \dots\}$

CMSC 330 Spring 2024

9

9

Operations Examples

Let $L_1 = \{a, b\}$, $L_2 = \{1, 2, 3\}$ (and $\Sigma = \{a,b,1,2,3\}$)

- ▶ What is L_1L_2 ?
 - $\{a1, a2, a3, b1, b2, b3\}$
- ▶ What is $L_1 \cup L_2$?
 - $\{a, b, 1, 2, 3\}$
- ▶ What is L_1^* ?
 - $\{\epsilon, a, b, aa, bb, ab, ba, aaa, aab, bba, bbb, aba, abb, baa, bab, \dots\}$

CMSC 330 Spring 2024

10

10

Quiz 1: Which string is **not** in L_3

$L_1 = \{a, ab, c, d, \epsilon\}$ where $\Sigma = \{a,b,c,d\}$

$L_2 = \{d\}$

$L_3 = L_1 \cup L_2$

- A. cd
- B. c
- C. ϵ
- D. d

CMSC 330 Spring 2024

11

11

Quiz 1: Which string is **not** in L_3

$L_1 = \{a, ab, c, d, \epsilon\}$ where $\Sigma = \{a,b,c,d\}$

$L_2 = \{d\}$

$L_3 = L_1 \cup L_2$

- A. cd
- B. c
- C. ϵ
- D. d

CMSC 330 Spring 2024

12

12

Quiz 2: Which string is **not** in L_3

$L_1 = \{a, ab, c, d, \epsilon\}$ where $\Sigma = \{a,b,c,d\}$
 $L_2 = \{d\}$
 $L_3 = L_1(L_2^*)$

- A. a
- B. abd
- C. abdd
- D. adad

CMSC 330 Spring 2024

13

13

Quiz 2: Which string is **not** in L_3

$L_1 = \{a, ab, c, d, \epsilon\}$ where $\Sigma = \{a,b,c,d\}$
 $L_2 = \{d\}$
 $L_3 = L_1(L_2^*)$

- A. a
- B. abd
- C. abdd
- D. adad

CMSC 330 Spring 2024

14

14

Regular Expressions: Grammar

► We can define a grammar for regular expressions R

- $R ::= \emptyset$ The empty language
- ϵ The empty string
- σ A symbol from alphabet Σ
- R_1R_2 The concatenation of two regexps
- $R_1|R_2$ The union of two regexps
- R^* The Kleene closure of a regexp

CMSC 330 Spring 2024

15

15

Regular Languages

- ▶ Regular expressions denote languages. These are the **regular languages**
 - aka **regular sets**
- ▶ Not all languages are regular
 - Examples (without proof):
 - > The set of palindromes over Σ
 - > $\{a^n b^n \mid n > 0\}$ (a^n = sequence of n a 's)
- ▶ Almost all programming languages are not regular
 - But aspects of them sometimes are (e.g., identifiers)
 - Regular expressions are commonly used in parsing tools

CMSC 330 Spring 2024

16

16

Semantics: Regular Expressions (1)

- ▶ Given an alphabet Σ , the **regular expressions** over Σ are defined inductively as follows

Constants

regular expression	denotes language
\emptyset	\emptyset
ϵ	$\{\epsilon\}$
each symbol $\sigma \in \Sigma$	$\{\sigma\}$

Ex: with $\Sigma = \{a, b\}$, regex a denotes language $\{a\}$
 regex b denotes language $\{b\}$

CMSC 330 Spring 2024

17

17

Semantics: Regular Expressions (2)

- ▶ Let A and B be regular expressions denoting languages L_A and L_B , respectively. Then:

Operations

regular expression	denotes language
AB	$L_A L_B$
$A B$	$L_A \cup L_B$
A^*	L_A^*

- ▶ There are no other regular expressions over Σ

CMSC 330 Spring 2024

18

18

Terminology etc.

- ▶ Regexps apply operations to symbols
 - Generates a set of strings (i.e., a language)
 - > (Formal definition shortly)
 - Examples
 - > a generates language $\{a\}$
 - > $a|b$ generates language $\{a\} \cup \{b\} = \{a, b\}$
 - > a^* generates language $\{\epsilon\} \cup \{a\} \cup \{aa\} \cup \dots = \{\epsilon, a, aa, \dots\}$
- ▶ If $s \in$ language L generated by a RE r , we say that r **accepts**, **describes**, or **recognizes** string s

CMSC 330 Spring 2024

19

19

Precedence

- ▶ Order in which operators are applied is:
 - Kleene closure $*$ > concatenation > union $|$
 - $ab|c = (a b) | c \rightarrow \{ab, c\}$
 - $ab^* = a (b^*) \rightarrow \{a, ab, abb \dots\}$
 - $a|b^* = a | (b^*) \rightarrow \{a, \epsilon, b, bb, bbb \dots\}$
- ▶ We use parentheses $()$ to clarify
 - E.g., $a(b|c)$, $(ab)^*$, $(a|b)^*$
 - Using escaped \backslash if parens are in the alphabet

CMSC 330 Spring 2024

20

20

Regular Expressions

- ▶ Almost all of the features we've seen for REs can be reduced to this formal definition
 - $OCaml$ – concatenation of single-symbol REs
 - $/(OCaml|Rust)/$ – union
 - $/(OCaml)^*/$ – Kleene closure
 - $/(OCaml)^+ /$ – same as $(Ruby)(Ruby)^*$
 - $/(OCaml)? /$ – same as $\{\epsilon\}(Ruby)$
 - $/[a-z]/$ – same as $(a|b|c|\dots|z)$
 - $/[^\wedge0-9]/$ – same as $(a|b|c|\dots)$ for $a,b,c,\dots \in \Sigma - \{0..9\}$
 - $^\wedge, \$$ – correspond to extra symbols in alphabet
 - > Think of every string containing a distinct, hidden symbol at its start and at its end – these are written $^\wedge$ and $\$$

CMSC 330 Spring 2024

21

21

Implementing Regular Expressions

- ▶ We can implement a regular expression by turning it into a **finite automaton**
 - A “machine” for recognizing a regular language

CMSC 330 Spring 2024

22

22

Finite Automaton

- Elements
- States S (start, final)
 - Alphabet Σ
 - Transition edges δ

CMSC 330 Spring 2024

23

23

Finite Automaton

- ▶ Machine starts in **start** or **initial** state
- ▶ Repeat until the end of the string s is reached
 - Scan the next symbol $\sigma \in \Sigma$ of the string s
 - Take **transition edge** labeled with σ
- ▶ String s is **accepted** if automaton is in **final** state when end of string s is reached

CMSC 330 Spring 2024

24

24

Finite Automaton: States

Start state

- State with incoming transition from no other state
- Can have only one start state

Final states

- States with double circle
- Can have zero or more final states
- Any state, including the start state, can be final

CMSC 330 Spring 2024

25

25

Finite Automaton: Example 1

001011

Accepted?
Yes

CMSC 330 Spring 2024

26

26

Finite Automaton: Example 2

001010

Accepted?
No

CMSC 330 Spring 2024

27

27

Quiz 3: What Language is This?

- A. All strings over $\{0, 1\}$
- B. All strings over $\{1\}$
- C. All strings over $\{0, 1\}$ of length 1
- D. All strings over $\{0, 1\}$ that end in 1

CMSC 330 Spring 2024

28

28

Quiz 3: What Language is This?

- A. All strings over $\{0, 1\}$
- B. All strings over $\{1\}$
- C. All strings over $\{0, 1\}$ of length 1
- D. All strings over $\{0, 1\}$ that end in 1
regular expression for this language is $(0^*1)^*$

CMSC 330 Spring 2024

29

29

Finite Automaton: Example 3

string	state at end	accept s?
aabcc		

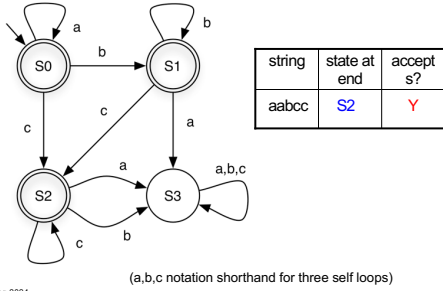

(a,b,c notation shorthand for three self loops)

CMSC 330 Spring 2024

30

30

Finite Automaton: Example 3

CMSC 330 Spring 2024

CMSC 330 Spring 2024

34

34

Finite Automaton: Example 3

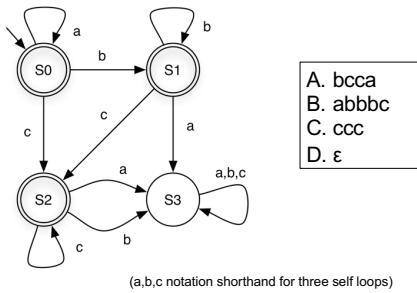

CMSC 330 Spring 2024

35

35

Quiz 4: Which string is **not** accepted?

CMSC 330 Spring 2024

40

40

Quiz 4: Which string is **not** accepted?

- A. **bcca**
- B. abbbc
- C. ccc
- D. ϵ

(a,b,c notation shorthand for three self loops)

CMSC 330 Spring 2024

41

41

Finite Automaton: Example 3

What language does this FA accept?

$a^*b^*c^*$

S3 is a **dead state** – a nonfinal state with **no** transition to another state – aka a **trap state**

CMSC 330 Spring 2024

42

42

Finite Automaton: Example 4

Language?

$a^*b^*c^*$ again, so FAs are not unique

CMSC 330 Spring 2024

43

43

Dead State: Shorthand Notation

- ▶ If a transition is omitted, assume it goes to a dead state that is not shown

- ▶ **Language?**
 - Strings over $\{0,1,2,3\}$ with alternating even and odd digits, beginning with odd digit

CMSC 330 Spring 2024

44

44

Finite Automaton: Example 5

- ▶ Description for each state
 - S0 = "Haven't seen anything yet" OR "Last symbol seen was a b"
 - S1 = "Last symbol seen was an a"
 - S2 = "Last two symbols seen were ab"
 - S3 = "Last three symbols seen were abb"

CMSC 330 Spring 2024

45

45

Finite Automaton: Example 5

- ▶ **Language** as a regular expression?
 - ▶ $(ab)^*abb$

CMSC 330 Spring 2024

46

46

Quiz 5

Over $\Sigma=\{a,b\}$, this FA accepts only:

- A. A string that contains a single b.
- B. Any string in $\{a,b\}$.
- C. A string that starts with b followed by a's.
- D. One or more b's, followed by zero or more a's.

CMSC 330 Spring 2024

47

47

Quiz 5

Over $\Sigma=\{a,b\}$, this FA accepts only:

- A. A string that contains a single b.
- B. Any string in $\{a,b\}$.
- C. A string that starts with b followed by a's.
- D. One or more b's, followed by zero or more a's.

CMSC 330 Spring 2024

48

48

Exercises: Define an FA over $\Sigma = \{0, 1\}$

- ▶ That accepts strings containing two consecutive 0s followed by two consecutive 1s
- ▶ That accepts strings with an odd number of 1s
- ▶ That accepts strings containing an even number of 0s and any number of 1s
- ▶ That accepts strings containing an odd number of 0s and odd number of 1s
- ▶ That accepts strings that **DO NOT** contain odd number of 0s and an odd number of 1s

CMSC 330 Spring 2024

49

49

Exercises: Define an FA over $\Sigma = \{0,1\}$

- ▶ That accepts strings with an odd number of 1s

CMSC 330 Spring 2024

50

50

Exercises: Define an FA over $\Sigma = \{0,1\}$

- ▶ That accepts strings with an odd number of 1s

CMSC 330 Spring 2024

51

51

Exercises: Define an FA over $\Sigma = \{a,b\}$

- ▶ That accepts strings containing an even number of a's and any number of b's

CMSC 330 Spring 2024

52

52

Exercises: Define an FA over $\Sigma = \{0, 1\}$

- ▶ That accepts strings containing an even number of 0s and any number of 1s

CMSC 330 Spring 2024

53

53

Exercises: Define an FA over $\Sigma = \{0, 1\}$

- ▶ That accepts strings containing two consecutive 0s followed by two consecutive 1s

CMSC 330 Spring 2024

54

54

Exercises: Define an FA over $\Sigma = \{0, 1\}$

- ▶ That accepts strings containing two consecutive 0s very immediately (right after, no other things in between) followed by two consecutive 1s

CMSC 330 Spring 2024

55

55

Exercises: Define an FA over $\Sigma = \{0, 1\}$

- ▶ That accepts strings **end with two consecutive 0s** followed by two consecutive **1s**

CMSC 330 Spring 2024

56

56

Exercises: Define an FA over $\Sigma = \{0, 1\}$

- ▶ That accepts strings **end with two consecutive 0s** followed by two consecutive **1s**

CMSC 330 Spring 2024

57

57

Exercises: Define an FA over $\Sigma = \{0, 1\}$

- ▶ That accepts strings containing an **odd number of 0s** and **odd number of 1s**

CMSC 330 Spring 2024

58

58

Exercises: Define an FA over $\Sigma = \{0, 1\}$

- ▶ That accepts strings containing an **odd** number of **0s** and **odd** number of **1s**

4 states:

0s	1s
e	e
o	e
e	o
o	o

CMSC 330 Spring 2024

59

59

Exercises: Define an FA over $\Sigma = \{0, 1\}$

- ▶ That accepts strings that **DO NOT** contain odd number of 0s and an odd number of 1s

CMSC 330 Spring 2024

60

60

Exercises: Define an FA over $\Sigma = \{0, 1\}$

- ▶ That accepts strings that **DO NOT** contain odd number of 0s and an odd number of 1s

Flip each state
