

# CMSC 330: Organization of Programming Languages

---

## Operational Semantics

# Formal Semantics of a Prog. Lang.

---

- ▶ Mathematical description of the meaning of programs written in that language
  - What a program computes, and what it does

"1+2"

Concrete  
Syntax

Parse

**Plus (Int 1, Int 2)**

Abstract  
Syntax

- ▶ What does **Plus (Int 1, Int 2)** mean?

# Operational semantics

---

- ▶ Define how programs execute
  - Often on an abstract machine (mathematical model of computer)
  - Analogous to interpretation
- ▶ We will define an operational semantics for Micro-Ocaml
  - And develop an interpreter for it, along the way
- ▶ Approach: use **rules** to define a **judgment**

$$e \Rightarrow v$$

# Micro-OCaml Expression Grammar

---

$e ::= x \mid n \mid e + e \mid \text{let } x = e1 \text{ in } e2$

Corresponding AST:

```
type id = string
type exp =
  | Ident of id           (* x *)
  | Num of int           (* n *)
  | Plus of exp * exp    (* e+e *)
  | Let of id * exp * exp (* let x=e1 in e2 *)
```

# Defining the Semantics

---

- ▶ Use **rules** to define judgment  $e \Rightarrow v$
- ▶ Inference Rules

$$\frac{H_1, H_2 \dots H_n}{C}$$

$$\frac{\forall x (Man(x) \rightarrow Mortal(x))}{\frac{Man(Socrates)}{\therefore Mortal(Socrates)}}$$

$$H_1 \wedge H_2 \wedge \dots \wedge H_n \Rightarrow C$$

# Rules are Lego Blocks

# Rules of Inference: Num and Sum

---

$n \Rightarrow n$

$e1 \Rightarrow n1 \quad e2 \Rightarrow n2 \quad n3 \text{ is } n1+n2$

$e1 + e2 \Rightarrow n3$

```
match e with
| Num n -> n
| Plus (e1,e2) ->
    let n1 = eval e1 in
    let n2 = eval e2 in
    let n3 = n1 + n2 in
    n3
```

# Rules of Inference: Let

---

$$e1 \Rightarrow v1 \quad e2\{v1/x\} \Rightarrow v2$$

---

$$\text{let } x = e1 \text{ in } e2 \Rightarrow v2$$

```
match e with
| Let (x,e1,e2) ->
    let v1 = eval e1 in
    let e2' = subst v1 x e2 in
    let v2 = eval e2'
    in v2
```

# Derivations

---

- ▶ When we apply rules to an expression in succession, we produce a **derivation**
  - It's a kind of **tree**, rooted at the conclusion
- ▶ Produce a derivation by **goal-directed search**
  - Pick a rule that could prove the goal
  - Then repeatedly apply rules on the corresponding hypotheses
    - **Goal: Show that `let x = 4 in x+3 ⇒ 7`**

# Derivations

---

$$\frac{}{n \Rightarrow n}$$

$$\frac{e1 \Rightarrow n1 \quad e2 \Rightarrow n2 \quad n3 \text{ is } n1+n2}{e1 + e2 \Rightarrow n3}$$

$$\frac{e1 \Rightarrow v1 \quad e2\{v1/x\} \Rightarrow v2}{\text{let } x = e1 \text{ in } e2 \Rightarrow v2}$$

Goal: show that

$$\text{let } x = 4 \text{ in } x+3 \Rightarrow 7$$

$$\frac{4 \Rightarrow 4 \quad 3 \Rightarrow 3 \quad 7 \text{ is } 4+3}{}$$

$$\frac{4 \Rightarrow 4 \quad 4+3 \Rightarrow 7}{\text{let } x = 4 \text{ in } x+3 \Rightarrow 7}$$

# Quiz 1

---

What is derivation of the following judgment?

$$2 + (3 + 8) \Rightarrow 13$$

(a)

$$2 \Rightarrow 2 \quad 3 + 8 \Rightarrow 11$$

-----

$$2 + (3 + 8) \Rightarrow 13$$

(b)

$$8 \Rightarrow 8$$

$$3 \Rightarrow 3$$

11 is 3+8

-----

$$2 \Rightarrow 2 \quad 3 + 8 \Rightarrow 11 \quad 13 \text{ is } 2+11$$

-----

$$2 + (3 + 8) \Rightarrow 13$$

(c)

$$3 \Rightarrow 3 \quad 8 \Rightarrow 8$$

-----

$$3 + 8 \Rightarrow 11$$

$$2 \Rightarrow 2$$

-----

$$2 + (3 + 8) \Rightarrow 13$$

# Quiz 1

---

What is derivation of the following judgment?

$$2 + (3 + 8) \Rightarrow 13$$

(a)

$$\begin{array}{l} 2 \Rightarrow 2 \quad 3 + 8 \Rightarrow 11 \\ \hline 2 + (3 + 8) \Rightarrow 13 \end{array}$$

(b)

$$\begin{array}{l} 8 \Rightarrow 8 \\ 3 \Rightarrow 3 \\ 11 \text{ is } 3+8 \\ \hline 2 \Rightarrow 2 \quad 3 + 8 \Rightarrow 11 \quad 13 \text{ is } 2+11 \\ \hline 2 + (3 + 8) \Rightarrow 13 \end{array}$$

(c)

$$\begin{array}{l} 3 \Rightarrow 3 \quad 8 \Rightarrow 8 \\ \hline 3 + 8 \Rightarrow 11 \quad 2 \Rightarrow 2 \\ \hline 2 + (3 + 8) \Rightarrow 13 \end{array}$$

# Definitional Interpreter

- ▶ The style of rules lends itself directly to the implementation of an **interpreter as a recursive function**

```
let rec eval (e:exp):value =  
  match e with  
  | Ident x -> (* no rule *)  
    failwith "no value"  
  | Num n -> n  
  | Plus (e1,e2) ->  
    let n1 = eval e1 in  
    let n2 = eval e2 in  
    let n3 = n1+n2 in  
    n3  
  | Let (x,e1,e2) ->  
    let v1 = eval e1 in  
    let e2' = subst v1 x e2 in  
    let v2 = eval e2' in v2
```

$$n \Rightarrow n$$
$$e1 \Rightarrow n1 \quad e2 \Rightarrow n2 \quad n3 \text{ is } n1+n2$$
$$e1 + e2 \Rightarrow n3$$
$$e1 \Rightarrow v1 \quad e2\{v1/x\} \Rightarrow v2$$
$$\text{let } x = e1 \text{ in } e2 \Rightarrow v2$$

# Derivations = Interpreter Call Trees

---

$$\frac{\frac{4 \Rightarrow 4 \quad 3 \Rightarrow 3 \quad 7 \text{ is } 4+3}{4+3 \Rightarrow 7}}{4 \Rightarrow 4} \quad \frac{}{\text{let } x = 4 \text{ in } x+3 \Rightarrow 7}$$

Has the same shape as the recursive call tree of the interpreter:

$$\frac{\frac{\text{eval Num } 4 \Rightarrow 4 \quad \text{eval Num } 3 \Rightarrow 3 \quad 7 \text{ is } 4+3}{\text{eval (subst 4 "x" Plus (Ident ("x"), Num 3)) \Rightarrow 7}}}{\text{eval Let ("x", Num 4, Plus (Ident ("x"), Num 3)) \Rightarrow 7}}$$

# Semantics Defines Program Meaning

---

- ▶  $e \Rightarrow v$  holds if and only if a *proof* can be built
  - Proofs are derivations: axioms at the top, then rules whose hypotheses have been proved to the bottom
  - No proof means there *exists no*  $v$  for which  $e \Rightarrow v$
- ▶ Proofs can be constructed bottom-up
  - In a goal-directed fashion
- ▶ Thus, function  $\text{eval } e = \{v \mid e \Rightarrow v\}$ 
  - Determinism of semantics implies at most one element for any  $e$
- ▶ So: Expression  $e$  *means*  $v$

# Environment-style Semantics

---

- ▶ So far, semantics used substitution to handle variables
  - As we evaluate, we replace all occurrences of a variable  $x$  with values it is bound to
- ▶ An alternative semantics, closer to a real implementation, is to use an **environment**
  - As we evaluate, we maintain an explicit map from variables to values, and look up variables as we see them

# Environments

---

- ▶ Mathematically, an environment is a **partial function** from identifiers to values
  - If  $A$  is an environment, and  $x$  is an identifier, then  $A(x)$  can either be
    - a value  $v$  (intuition: the value of the variable stored on the stack)
    - undefined (intuition: the variable has not been declared)
- ▶ An environment can be visualized as a table
  - If  $A$  is

Id	Val
$x$	0
$y$	2

- then  $A(x)$  is 0,  $A(y)$  is 2, and  $A(z)$  is undefined

# Notation, Operations on Environments

---

- ▶  $\bullet$  is the empty environment
- ▶  $A, \mathbf{x}:\mathbf{v}$  is the environment that extends  $A$  with a mapping from  $\mathbf{x}$  to  $\mathbf{v}$ 
  - Sometimes just write  $\mathbf{x}:\mathbf{v}$  instead of  $\bullet, \mathbf{x}:\mathbf{v}$  for brevity

- ▶ Lookup  $A(\mathbf{x})$  is defined as follows

$$\bullet(\mathbf{x}) = \text{undefined}$$

$$(A, \mathbf{y}:\mathbf{v})(\mathbf{x}) = \begin{cases} \mathbf{v} & \text{if } \mathbf{x} = \mathbf{y} \\ A(\mathbf{x}) & \text{if } \mathbf{x} \neq \mathbf{y} \text{ and } A(\mathbf{x}) \text{ defined} \\ \text{undefined} & \text{otherwise} \end{cases}$$

# Definitional Interpreter: Environments

---

```
type env = (id * value) list

let extend env x v = (x,v)::env

let rec lookup env x =
  match env with
  | [] -> failwith "undefined"
  | (y,v)::env' ->
    if x = y then v
    else lookup env' x
```

An environment is just a list of mappings,  
which are just pairs of variable to value  
- called an **association list**

# Semantics with Environments

---

- ▶ The environment semantics changes the judgment

$$e \Rightarrow v$$

to be

$$A; e \Rightarrow v$$

where  $A$  is an environment

- Idea:  $A$  is used to give values to the identifiers in  $e$

# Environment-style Rules

$$\frac{A(\mathbf{x}) = \mathbf{v}}{A; \mathbf{x} \Rightarrow \mathbf{v}}$$

Look up variable  $\mathbf{x}$  in environment  $A$

$$\frac{}{A; \mathbf{n} \Rightarrow \mathbf{n}}$$

$$\frac{A; \mathbf{e1} \Rightarrow \mathbf{v1} \quad A, \mathbf{x}:\mathbf{v1}; \mathbf{e2} \Rightarrow \mathbf{v2}}{A; \text{let } \mathbf{x} = \mathbf{e1} \text{ in } \mathbf{e2} \Rightarrow \mathbf{v2}}$$

Extend environment  $A$  with mapping from  $\mathbf{x}$  to  $\mathbf{v1}$

$$\frac{A; \mathbf{e1} \Rightarrow \mathbf{n1} \quad A; \mathbf{e2} \Rightarrow \mathbf{n2} \quad \mathbf{n3} \text{ is } \mathbf{n1} + \mathbf{n2}}{A; \mathbf{e1} + \mathbf{e2} \Rightarrow \mathbf{n3}}$$

# Definitional Interpreter: Evaluation

---

```
let rec eval env e =
  match e with
  | Ident x -> lookup env x
  | Num n -> n
  | Plus (e1,e2) ->
    let n1 = eval env e1 in
    let n2 = eval env e2 in
    let n3 = n1+n2 in
    n3
  | Let (x,e1,e2) ->
    let v1 = eval env e1 in
    let env' = extend env x v1 in
    let v2 = eval env' e2 in v2
```

## Quiz 2

---

What is a derivation of the following judgment?

$\bullet; \text{let } x=3 \text{ in } x+2 \Rightarrow 5$

(a)

$$\begin{array}{c} x \Rightarrow 3 \quad 2 \Rightarrow 2 \quad 5 \text{ is } 3+2 \\ \hline 3 \Rightarrow 3 \quad x+2 \Rightarrow 5 \\ \hline \text{let } x=3 \text{ in } x+2 \Rightarrow 5 \end{array}$$

(c)

$$\begin{array}{c} x:2; x \Rightarrow 3 \quad x:2; 2 \Rightarrow 2 \quad 5 \text{ is } 3+2 \\ \hline \bullet; \text{let } x=3 \text{ in } x+2 \Rightarrow 5 \end{array}$$

(b)

$$\begin{array}{c} x:3; x \Rightarrow 3 \quad x:3; 2 \Rightarrow 2 \quad 5 \text{ is } 3+2 \\ \hline \bullet; 3 \Rightarrow 3 \quad x:3; x+2 \Rightarrow 5 \\ \hline \bullet; \text{let } x=3 \text{ in } x+2 \Rightarrow 5 \end{array}$$

# Quiz 2

---

What is a derivation of the following judgment?

$\bullet; \text{let } x=3 \text{ in } x+2 \Rightarrow 5$

(a)

$$\begin{array}{c} x \Rightarrow 3 \quad 2 \Rightarrow 2 \quad 5 \text{ is } 3+2 \\ \hline 3 \Rightarrow 3 \quad x+2 \Rightarrow 5 \\ \hline \bullet; \text{let } x=3 \text{ in } x+2 \Rightarrow 5 \end{array}$$

(c)

$$\begin{array}{c} x:2; x \Rightarrow 3 \quad x:2; 2 \Rightarrow 2 \quad 5 \text{ is } 3+2 \quad \text{----} \\ \hline \bullet; \text{let } x=3 \text{ in } x+2 \Rightarrow 5 \end{array}$$

(b)

$$\begin{array}{c} x:3; x \Rightarrow 3 \quad x:3; 2 \Rightarrow 2 \quad 5 \text{ is } 3+2 \\ \hline \bullet; 3 \Rightarrow 3 \quad x:3; x+2 \Rightarrow 5 \\ \hline \bullet; \text{let } x=3 \text{ in } x+2 \Rightarrow 5 \end{array}$$

# Adding Conditionals to Micro-OCaml

---

```
e ::= x | v | e + e | let x = e in e  
| eq0 e | if e then e else e  
  
v ::= n | true | false
```

- ▶ In terms of interpreter definitions:

```
type exp =  
  | Val of value  
  | ... (* as before *)  
  | Eq0 of exp  
  | If of exp * exp * exp  
  
type value =  
  | Int of int  
  | Bool of bool
```

# Rules for Eq0 and Booleans

---

$$A; \text{true} \Rightarrow \text{true}$$
$$A; \text{false} \Rightarrow \text{false}$$
$$A; e \Rightarrow 0$$
$$A; \text{eq0 } e \Rightarrow \text{true}$$
$$A; e \Rightarrow v \quad v \neq 0$$
$$A; \text{eq0 } e \Rightarrow \text{false}$$

# Rules for Conditionals

---

$$A; e1 \Rightarrow \text{true} \quad A; e2 \Rightarrow v$$
$$A; \text{if } e1 \text{ then } e2 \text{ else } e3 \Rightarrow v$$
$$A; e1 \Rightarrow \text{false} \quad A; e3 \Rightarrow v$$
$$A; \text{if } e1 \text{ then } e2 \text{ else } e3 \Rightarrow v$$

- ▶ Notice that only one branch is evaluated

# Quiz 3

What is the derivation of the following judgment?

•; if eq0 3-2 then 5 else 10  $\Rightarrow$  10

(a)

```
•; 3  $\Rightarrow$  3    •; 2  $\Rightarrow$  2    3-2 is 1
-----
•; eq0 3-2  $\Rightarrow$  false          •; 10  $\Rightarrow$  10
-----
•; if eq0 3-2 then 5 else 10  $\Rightarrow$  10
```

(b)

```
3  $\Rightarrow$  3    2  $\Rightarrow$  2
3-2 is 1
-----
eq0 3-2  $\Rightarrow$  false          10  $\Rightarrow$  10
-----
if eq0 3-2 then 5 else 10  $\Rightarrow$  10
```

(c)

```
•; 3  $\Rightarrow$  3
•; 2  $\Rightarrow$  2
3-2 is 1
-----
•; 3-2  $\Rightarrow$  1    1  $\neq$  0
-----
•; eq0 3-2  $\Rightarrow$  false          •; 10  $\Rightarrow$  10
-----
•; if eq0 3-2 then 5 else 10  $\Rightarrow$  10
```

# Quiz 3

What is the derivation of the following judgment?

•; if eq0 3-2 then 5 else 10  $\Rightarrow$  10

(a)

```
•; 3  $\Rightarrow$  3    •; 2  $\Rightarrow$  2    3-2 is 1
-----
•; eq0 3-2  $\Rightarrow$  false          •; 10  $\Rightarrow$  10
-----
•; if eq0 3-2 then 5 else 10  $\Rightarrow$  10
```

(b)

```
3  $\Rightarrow$  3    2  $\Rightarrow$  2
3-2 is 1
-----
eq0 3-2  $\Rightarrow$  false          10  $\Rightarrow$  10
-----
if eq0 3-2 then 5 else 10  $\Rightarrow$  10
```

(c)

```
•; 3  $\Rightarrow$  3
•; 2  $\Rightarrow$  2
3-2 is 1
-----
•; 3-2  $\Rightarrow$  1          1  $\neq$  0
-----
•; eq0 3-2  $\Rightarrow$  false          •; 10  $\Rightarrow$  10
-----
•; if eq0 3-2 then 5 else 10  $\Rightarrow$  10
```

# Updating the Interpreter

---

```
let rec eval env e =
  match e with
  | Ident x -> lookup env x
  | Val v -> v
  | Plus (e1,e2) ->
    let Int n1 = eval env e1 in
    let Int n2 = eval env e2 in
    let n3 = n1+n2 in
    Int n3
  | Let (x,e1,e2) ->
    let v1 = eval env e1 in
    let env' = extend env x v1 in
    let v2 = eval env' e2 in v2
  | Eq0 e1 ->
    let Int n = eval env e1 in
    if n=0 then Bool true else Bool false
  | If (e1,e2,e3) ->
    let Bool b = eval env e1 in
    if b then eval env e2
    else eval env e3
```

# Adding Closures to Micro-OCaml

```
e ::= x | v | e + e | let x = e in e  
| eq0 e | if e then e else e  
| e e | fun x -> e
```

```
v ::= n | true | false | (A, λx.e)
```

Environment

Code  
(id and exp)

- ▶ In terms of interpreter definitions:

```
type exp =  
| Val of value  
| If of exp * exp * exp  
... (* as before *)  
| Call of exp * exp  
| Fun of id * exp
```

```
type value =  
Int of int  
| Bool of bool  
| Closure of env * id * exp
```

# Rule for Closures: Lexical/Static Scoping

---

$$A; \text{fun } x \rightarrow e \Rightarrow (A, \lambda x. e)$$
$$\frac{A; e1 \Rightarrow (A', \lambda x. e) \quad A; e2 \Rightarrow v1 \quad A', x: v1; e \Rightarrow v}{A; e1 \ e2 \Rightarrow v}$$

## ► Notice

- Creating a closure captures the current environment  $A$
- A call to a function
  - evaluates the body of the closure's code  $e$  with function closure's environment  $A'$  extended with parameter  $x$  bound to argument  $v1$

# Rule for Closures: Dynamic Scoping

---

$$A; \text{fun } x \rightarrow e \Rightarrow (\bullet, \lambda x. e)$$
$$A; e1 \Rightarrow (\bullet, \lambda x. e) \quad A; e2 \Rightarrow v1 \quad A, x: v1; e \Rightarrow v$$
$$A; e1 \ e2 \Rightarrow v$$

## ► Notice

- Creating a closure ignores the current environment  $A$
- A call to a function
  - evaluates the body of the closure's code  $e$  with the current environment  $A$  extended with parameter  $x$  bound to argument  $v1$

# Scaling up

---

- ▶ Operational semantics can handle full languages
  - With records, recursive variant types, objects, first-class functions, and more
- ▶ Provides a concise notation for explaining what a language does. Clearly shows:
  - Evaluation order
  - Call-by-value vs. call-by-name
  - Static scoping vs. dynamic scoping
  - ... We may look at more of these later

# Scaling up: Lego City

---
