CMSC427
Geometry and Vectors
Review: where are we?

• Parametric curves and Hw1?
  • Going beyond the course: generative art
  • https://www.openprocessing.org
  • Brandon Morse, Art Dept, ART370

• Polylines, Processing and Lab0?
  • Questions on Processing?
  • https://processing.org
  • Learning Processing – Dan Shiffman
How can we …

• Find a line perpendicular to another?

• Find symmetric reflecting vector on a mirror?

• Find the distance from a point to a line?

• Figure out if a facet is facing the camera?
• Polyline as sequence of locations (points)
• Polylines as points plus a sequence of vectors
• Assumption: Displacements << Locations, fewer bits
Polyline as vectors

- Polyline as point plus sequence of vectors
- Assumption: displacements $\ll$ locations, fewer bits

\[
P1 = P0 + V1
\]
\[
P2 = P1 + V1 = P0 + V1 + V2
\]
Vector and vector operations

• Objects:
  • Points \((x,y)\) – represent position
  • Vector \(<x,y>\) – represent displacement, direction

• Operations:
  • Vector addition, subtraction, scaling
  • Vector magnitude
  • Vector dot product
  • Vector cross product
  • Linear, affine and convex combinations

• Applications:
  • Representations: using vectors for lines, planes, others
  • Metrics: angle between lines, distances between objects
  • Tests: are two lines perpendicular, is a facet visible?
• Direction and distance
• Describes
  • Difference between points
  • Speed, translation, axes

• Notation
  • In bold \( \mathbf{a} \)
  • Angle brackets \( \mathbf{a} = \langle x, y \rangle \)

• Free vectors
  • No anchor point
  • Displacement, not location
Vector scaling

Multiplication by scalar $sa$

$a$

$0.5a$

$-1a = -a$
Vector addition and subtraction

\[ c = a + b \]

\[ c = a - b \]
Vector addition and subtraction

What is \( \mathbf{c} \) in terms of \( \mathbf{a} \) and \( \mathbf{b} \)?
What is \( c \) in terms of \( a \) and \( b \)?

\[
a + c = b
\]
What is $c$ in terms of $a$ and $b$?

$a + c = b$

c = b - a
Coordinate vs. coordinate-free representation

Coordinate-free equation
Valid for 2D and 3D

Prefer when possible

Coordinate equation
\[ a = <3,3> \]
\[ b = <4,2> \]
\[ c = b - a = <4,2> - <3,3> = <1,-1> \]
Parametric line in coordinate-free vector format

\[ x = t \, dx + px \]
\[ y = t \, dy + py \]

Set
\[ \mathbf{V} = P1 - P0 \]
\[ = \langle dx, dy \rangle \]

Then
\[ P(t) = t \, \mathbf{V} + P0 \]

Good in 2D and 3D
Vector magnitude

The magnitude (length) of a vector is

\[ |\mathbf{v}|^2 = v_x^2 + v_y^2 \]

\[ |\mathbf{v}| = \sqrt{v_x^2 + v_y^2} \]

A vector of length 1.0 is called a *unit vector*

To *normalize* a vector is to rescale it to unit length

\[ \mathbf{n}_v = \frac{\mathbf{v}}{|\mathbf{v}|} \]

Normal vectors represent direction and are used for:
- light direction,
- surface normals,
- rotation axes
Dot product

• Inner product between two vectors
• Defined using coordinate-free cosine rule

\[ \mathbf{a} \cdot \mathbf{b} = |\mathbf{a}| |\mathbf{b}| \cos(\theta) \]
Dot product

- Inner product between two vectors
- Defined using coordinate-free cosine rule

\[ \mathbf{a} \cdot \mathbf{b} = |\mathbf{a}||\mathbf{b}|\cos(\theta) \]

- Example:

\[ \mathbf{a} = <1,1> \]
\[ \mathbf{b} = <1,0> \]
\[ \theta = \pi/2 \]
\[ \mathbf{a} \cdot \mathbf{b} = 1.4142 \times 1 \times 0.70711 = 1 \]
Dot product – coordinate version

• Given

\[ a = \langle a_x, a_y \rangle \quad b = \langle b_x, b_y \rangle \]

• Then

\[ a \cdot b = a_x b_x + a_y b_y \]

• In n dimensions

\[ a \cdot b = \sum_{i=1}^{n} a_i b_i \]
• Given

\[ \mathbf{a} = \langle a_x, a_y \rangle \quad \mathbf{b} = \langle b_x, b_y \rangle \]

• Then

\[ \mathbf{a} \cdot \mathbf{b} = a_x b_x + a_y b_y \]

• Example revised:

\[ \mathbf{a} = \langle 1, 1 \rangle \]
\[ \mathbf{b} = \langle 1, 0 \rangle \]
\[ \mathbf{a} \cdot \mathbf{b} = 1 \cdot 1 + 1 \cdot 0 = 1 \]
Dot product: computing angle (and cosine)

- Given \( \mathbf{a} \cdot \mathbf{b} = |\mathbf{a}||\mathbf{b}|\cos(\theta) \)
- We have
  \[
  \cos(\theta) = \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}||\mathbf{b}|}
  \]
  \[
  \theta = \cos^{-1}\left(\frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}||\mathbf{b}|}\right)
  \]

- Example
  \[
  \mathbf{a} = \langle 1,1 \rangle, \mathbf{b} = \langle 1,0 \rangle
  \]
  \[
  \mathbf{a} \cdot \mathbf{b} = 1 \times 1 + 1 \times 0 = 1
  \]
  \[
  |\mathbf{a}| = 1.4142, |\mathbf{b}| = 1.0
  \]
  \[
  \frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}||\mathbf{b}|} = \frac{1}{1.4142} = 0.70711
  \]
  \[
  \cos^{-1}\left(\frac{\mathbf{a} \cdot \mathbf{b}}{|\mathbf{a}||\mathbf{b}|}\right) = 0.78540 = \pi/4
  \]
Dot product: testing perpendicularity

- Since
  \[ \cos(90^\circ) = \cos \left( \frac{\pi}{2} \right) = 0 \]
- Then a perpendicular to \( b \) gives
  \[ a \perp b \Rightarrow a \cdot b = 0 \]
- Examples
  - \( a = \langle 1, 0 \rangle, b = \langle 0, 1 \rangle \)
    \[ a \cdot b = 1 \cdot 0 + 1 \cdot 0 = 0 \]
  - \( a = \langle 1, 1 \rangle, b = \langle -1, 1 \rangle \)
    \[ a \cdot b = 1 \cdot -1 + 1 \cdot 1 = 0 \]
Perp vector and lines

• Given vector

\[ \mathbf{v} = \langle v_x, v_y \rangle \]

• The perp vector is

\[ = \langle -v_y, v_x \rangle \]

• So

\[ \mathbf{v} \cdot \mathbf{v}^\perp = 0 \]
Given line segment P0 to P1, what line is perpendicular through the midpoint?
Given line segment P0 to P1, what line is perpendicular through the midpoint?

- \( n = \frac{v_{\text{perp}}}{|v_{\text{perp}}|} \)
- \( v = P1 - P0 \)
- \( m = \frac{P0 + P1}{2} \)

**Midpoint bisector**

- \( P0 = (1,1) \)
- \( P1 = (5,3) \)
• Result: bisector is
  \[ P = tn + m \]

• With \( n \) normalized perp vector, \( m \) midpoint

• Appropriate range of \( t \)?

\[ P0 = (1,1) \]
\[ P1 = (5,3) \]
\[ n = \frac{v_{\text{perp}}}{|v_{\text{perp}}|} \]
\[ m = \frac{(P0+P1)}{2} \]
\[ P = tn + m \]
Midpoint displacement terrain (2D recursive algorithm)

- Given two points $P_0, P_1$
  - Compute midpoint $m$
  - Compute bisector line $P = tn + m$
  - Pick random $t$, generate $P'$
  - Call recursively on segments $P_0-P'$, $P'-P_1$

- Tuning needed on magnitude of displacement
Midpoint displacement terrain (3D recursive algorithm)

- Start with four points P0, P1, P2, P3
- Divide (quads or triangles?)
- Compute midpoint bisector (how?)
- Displace, repeat

Hunter Loftis
Cross product

$\mathbf{a} \times \mathbf{b}$

- Read as “a cross b”
- $\mathbf{a} \times \mathbf{b}$ is a vector perpendicular to both $\mathbf{a}$ and $\mathbf{b}$, in the direction defined by the right hand rule
\[ \mathbf{a} \times \mathbf{b} \]

- Read as “a cross b”
- \( \mathbf{a} \times \mathbf{b} \) is a vector \textit{perpendicular} to both \( \mathbf{a} \) and \( \mathbf{b} \), in the direction defined by the right hand rule
- Vector \( \mathbf{a} \) and \( \mathbf{b} \) lie in the plane of the projection screen.
- Does \( \mathbf{a} \times \mathbf{b} \) point towards you or away from you?

What about \( \mathbf{b} \times \mathbf{a} \)?
• How compute normal vector to triangle P0, P1, P3?
• Assume up is out of page
How compute normal vector to triangle P0, P1, P3?

Assume up is out of page

One answer:
\[ n = (P1 - P3) \times (P0 - P1) \]
• Parallelogram rule
  \[ |\mathbf{a} \times \mathbf{b}| = |\mathbf{a}||\mathbf{b}||\sin(\theta)| \]
• Area of mesh triangle?
• When would cross product be zero?
  \[ |\mathbf{a} \times \mathbf{b}| = 0 \]
Cross product: length of $\mathbf{a} \times \mathbf{b}$

- Parallelogram rule
  $$|\mathbf{a} \times \mathbf{b}| = |\mathbf{a}||\mathbf{b}||\sin(\theta)|$$
- Area of mesh triangle?
- When would cross product be zero?
  $$|\mathbf{a} \times \mathbf{b}| = 0$$
- Either $\mathbf{a}$,$\mathbf{b}$ parallel, or either degenerate
Cross product: computing, vector approach

\[ \mathbf{a} \times \mathbf{b} = \begin{bmatrix} a_y b_z - a_z b_y \\ a_z b_x - a_x b_z \\ a_x b_y - a_y b_x \end{bmatrix} \]
Cross product: computing, matrix approach

- Determinant of
  \[ \mathbf{a} \times \mathbf{b} = \begin{vmatrix} i & j & k \\ a_x & a_y & a_z \\ b_x & b_y & b_z \end{vmatrix} \]

- Computed with 3 lower minors
  \[ \mathbf{a} \times \mathbf{b} = i \begin{vmatrix} a_y & a_z \\ b_y & b_z \end{vmatrix} - j \begin{vmatrix} a_x & a_z \\ b_x & b_z \end{vmatrix} + k \begin{vmatrix} a_x & a_y \\ b_x & b_y \end{vmatrix} \]

- with
  \[ \begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - cb \]

- i, j, k are unit vectors in directions of x, y and z axes
  - i=\langle1,0,0\rangle  \quad j=\langle0,1,0\rangle  \quad k=\langle0,0,1\rangle
Midpoint of triangle?
Answer 1:

Answer 1:

\[ m = \frac{P_0 + P_1 + P_2}{3} \]
Answer 2: Double interpolation (blending)

First interpolation: vector line P0 to P1

\[ P = tV + P0 \]
\[ = t(P1 - P0) + P0 \]
\[ = tP1 + (1 - t)P0 \]

Midpoint at \( t = 0.5 \)

\[ m0 = 0.5P1 + (1 - 0.5)P0 \]
\[ = 0.5P1 + 0.5P0 \]
\[ = \frac{P1 + P0}{2} \]
Answer 2: Double interpolation

Second interpolation: vector line m0 to P2

\[ P = sV' + m0 \]
\[ = s(P2 - m0) + m0 \]
\[ = sP2 + (1 - s)m0 \]

Midpoint at \( s = 1/3 \)

\[ m0 = \frac{1}{3} P2 + \left( 1 - \frac{1}{3} \right) m0 \]
\[ = \frac{1}{3} P2 + \frac{2}{3} m0 \]
\[ = \frac{1}{3} P2 + \frac{2}{3} \left( 0.5P1 + 0.5P0 \right) \]
\[ = \frac{P2 + P1 + P0}{3} \]
A convex combination of a set of points $S$ is a linear combination such that the non-negative coefficients sum to 1

$$C = \sum_{P \text{ in } S} \alpha_i P_i \quad \text{with} \quad \sum \alpha_i = 1 \quad \text{and} \quad 0 \leq \alpha_i \leq 1$$
A convex combination of a set of points $S$ is a linear combination such that the non-negative coefficients sum to 1

$$C = \sum_{P \text{ in } S} \alpha_i P_i \quad \text{with} \quad \sum \alpha_i = 1 \quad \text{and} \quad 0 \leq \alpha_i \leq 1$$

Is this equation for a line segment a convex combination?

$$P = tP1 + (1 - t)P0$$
Generalizing: convex combinations of points

A convex combination of a set of points $S$ is a linear combination such that the non-negative coefficients sum to 1

$$C = \sum_{P \in S} \alpha_i P_i \quad \text{with} \quad \sum \alpha_i = 1 \quad \text{and} \quad 0 \leq \alpha_i \leq 1$$

Is this equation for a line segment a convex combination?

$$P = tP1 + (1 - t)P0$$

Yes. With $t$ in $[0,1]$, $t$ and $(1-t) \geq 0$, and $t+(1-t) = 1$
A convex combination of a set of points $S$ is a linear combination such that the non-negative coefficients sum to $1$

$$C = \sum_{P \text{ in } S} \alpha_i P_i \quad \text{with} \quad \sum \alpha_i = 1 \quad \text{and} \quad 0 \leq \alpha_i \leq 1$$

Is this equation for a triangle a convex combination, assuming $s$ and $t$ are in $[0,1]$?

$$P = sP2 + (1 - s)(tP1 + (1 - t)P0)$$
$$= sP2 + (1 - s)(tP1) + (1 - s)(1 - t)P0$$
$$= sP2 + (t - st)P1 + (1 - s - t + st) P0$$
A convex combination of a set of points $S$ is a linear combination such that the non-negative coefficients sum to 1

$$C = \sum_{P \text{ in } S} \alpha_i P_i \quad \text{with} \quad \sum \alpha_i = 1 \quad \text{and} \quad 0 \leq \alpha_i \leq 1$$

For general polygon, all convex combinations of vertices yields convex hull
Linear, affine and convex combinations

Linear: No constraints on coefficients

\[ C = \sum_{P \in S} \alpha_i P_i \]

Affine: Coefficients sum to 1

\[ C = \sum_{P \in S} \alpha_i P_i \quad \text{with} \quad \sum \alpha_i = 1 \]

Convex: Coefficients sum to 1, each in [0,1]

\[ C = \sum_{P \in S} \alpha_i P_i \quad \text{with} \quad \sum \alpha_i = 1 \quad \text{and} \quad 0 \leq \alpha_i \leq 1 \]
Linear combinations of points vs. vectors

Point – point yields a ....

Vector – vector yields a ...

Point + vector yields a ...

Point + point yields a ...
Linear combinations of points vs. vectors

Point – point yields a .... vector
Vector – vector yields a ... vector
Point + vector yields a ... point
Point + point yields a ... ????? Not defined

Vectors are closed under addition and subtraction
Any linear combination valid

Points are not
  Affine combination that sums to 0 yields vector
  Affine combination that sums to 1 yields point
  Convex combination yields point in convex hull

Moral: When programming w/ pts&vtrs, know the output type
Applying vectors operations to polygons

Is a polygon winding clockwise?

Is a polygon convex?

Is a polygon simple?

Lab 1: add these methods to Polyline class
1. Normal form of line
2. Normal form of plane
3. Programming with points and vectors
4. Sign of dot product
5. Tweening
6. Distance from point to line
1. Notation for vectors \(<x,y>\) and pts \((x,y)\)
