**Bill** thinks of one— next page.

Let  $p_1, p_2, \ldots$  be an infinite set of points in  $\mathbb{R}$ .

Let  $p_1, p_2, \ldots$  be an infinite set of points in  $\mathbb{R}$ . Let  $COL : {\mathbb{N} \choose 2} \to \mathbb{R}$  be

 $COL(i,j) = |p_i - p_j|$  (Distance Between  $p_i$  and  $p_j$ ).

Let  $p_1, p_2, \ldots$  be an infinite set of points in  $\mathbb{R}$ . Let  $COL : {\mathbb{N} \choose 2} \to \mathbb{R}$  be

 $COL(i,j) = |p_i - p_j|$  (Distance Between  $p_i$  and  $p_j$ ).

**Result:** For any infinite set of points in the plane there is an infinite subset where all distances are distinct. (Already known by Erdös via diff proof.)

Let  $p_1, p_2, \ldots$  be an infinite set of points in  $\mathbb{R}$ . Let  $COL : {\mathbb{N} \choose 2} \to \mathbb{R}$  be

 $COL(i,j) = |p_i - p_j|$  (Distance Between  $p_i$  and  $p_j$ ).

**Result:** For any infinite set of points in the plane there is an infinite subset where all distances are distinct. (Already known by Erdös via diff proof.)

**Next Step:** Finite version: Can use Finite Can Ramsey to prove the following: For every set of *n* points in the plane there is a subset of size  $\Omega(\log n)$  where all distances are distinct. (Much better is known.)

# **EXAMPLES** with **DISTANCES**

The following is an **EXAMPLE** of the kind of theorems we will be talking about. If there are n points in  $\mathbb{R}^2$  then there is a subset of size  $\Omega(n^{1/3})$  with all distances between points **DIFF**.

If there are n points in  $\mathbb{R}^2$  then there is a subset of size  $\Omega(n^{1/5})$  with all triangle areas **DIFF**.

▲□▶ ▲□▶ ▲ 臣▶ ▲ 臣▶ ― 臣 … のへぐ

If there are n points in  $\mathbb{R}^2$  then there is a subset of size  $\Omega(n^{1/5})$  with all triangle areas **DIFF**.

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 - のへぐ

FALSE: Take *n* points on a LINE. All triangle areas are 0.

If there are n points in  $\mathbb{R}^2$  then there is a subset of size  $\Omega(n^{1/5})$  with all triangle areas **DIFF**.

FALSE: Take *n* points on a LINE. All triangle areas are 0.

We state theorems in **no three collinear** form to get around this issue.

**Def:** A (2)-Rainbow Set is a set of points in  $\mathbb{R}^d$  where all of the distances are distinct. Also called a **dist-rainbow**.

**Def:** A (2)-Rainbow Set is a set of points in  $\mathbb{R}^d$  where all of the distances are distinct. Also called a **dist-rainbow**. **Def:** A 3-Rainbow Set is a set of points in  $\mathbb{R}^d$  where all nonzero areas of triangles are distinct. Also called an **area-rainbow**.

**Def:** A (2)-Rainbow Set is a set of points in  $\mathbb{R}^d$  where all of the distances are distinct. Also called a **dist-rainbow**. **Def:** A 3-Rainbow Set is a set of points in  $\mathbb{R}^d$  where all nonzero areas of triangles are distinct. Also called an **area-rainbow**. **Def:** An *a*-Rainbow Set is a set of points in  $\mathbb{R}^d$  where all nonzero *a*-volumes are distinct. An *a*-volume is the volume enclosed by *a* points. Also called a **vol-rainbow**.

**Def:** A (2)-Rainbow Set is a set of points in  $\mathbb{R}^d$  where all of the distances are distinct. Also called a **dist-rainbow**. **Def:** A 3-Rainbow Set is a set of points in  $\mathbb{R}^d$  where all nonzero areas of triangles are distinct. Also called an **area-rainbow**. **Def:** An *a*-Rainbow Set is a set of points in  $\mathbb{R}^d$  where all nonzero *a*-volumes are distinct. An *a*-volume is the volume enclosed by *a* points. Also called a **vol-rainbow**.

**Def:** Let  $X \subseteq \mathbb{R}^d$ . A **Maximal Rainbow Set** is a rainbow set  $Y \subseteq X$  such that if any more points of X are added then it STOPS being a rainbow set.

**Def:** A (2)-Rainbow Set is a set of points in  $\mathbb{R}^d$  where all of the distances are distinct. Also called a **dist-rainbow**. **Def:** A 3-Rainbow Set is a set of points in  $\mathbb{R}^d$  where all nonzero areas of triangles are distinct. Also called an **area-rainbow**. **Def:** An *a*-Rainbow Set is a set of points in  $\mathbb{R}^d$  where all nonzero *a*-volumes are distinct. An *a*-volume is the volume enclosed by *a* points. Also called a **vol-rainbow**.

**Def:** Let  $X \subseteq \mathbb{R}^d$ . A **Maximal Rainbow Set** is a rainbow set  $Y \subseteq X$  such that if any more points of X are added then it STOPS being a rainbow set.

**Def:** Let  $X \subseteq \mathbb{R}^d$ . An *a*-Maximal Rainbow Set is a *a*-rainbow set  $Y \subseteq X$  such that if any more points of X are added then it STOPS being an *a*-rainbow set.

# **Lemma** If there is a MAP from X to Y that is $\leq c$ -to-1 then $|Y| \geq |X|/c$ . We will call this LEMMA.

f maps an element of X - M to reason  $x \notin M$ .  $f: X - M \to {M \choose 2} \times {M \choose 2} \cup {M \choose 2} \times {M \choose 3}$ . Recall that What is  $f^{-1}(\{x_1, x_2\}, \{x_1, x_3\})$ ? By Lemma all points on it are on a line- so  $\leq 2$  points. FINITE.

What is  $f^{-1}(\{x_1, x_2\}, \{x_3, x_4\})$ ? By Lemma all points on it are on a line- so  $\leq 2$  points. FINITE.

What is  $f^{-1}(\{x_1, x_2\}, \{x_3, x_4, x_5\})$ ? By Lemma all points on it are on a line- so  $\leq 2$  points. FINITE.  $f: X - M \rightarrow \binom{M}{2} \times \binom{M}{2} \cup \binom{M}{2} \times \binom{M}{3}$  FINITE-to-1?

#### Area d = 2 Case- Cont

$$f: X - M \to {\binom{M}{2}} \times {\binom{M}{2}} \cup {\binom{M}{2}} \times {\binom{M}{3}}$$
 is FINITE-to-1.  
Case 1:  $|M| \ge n^{1/5}$  DONE!

**Case 2:**  $|M| \le n^{1/5}$ . Then  $|X - M| = \Theta(|X|)$ . Since MAP is finite-to-1, by LEMMA

$$|\binom{M}{2} \times \binom{M}{2} \cup \binom{M}{2} \times \binom{M}{3}| \geq \Omega(|X - M|) = \Omega(|X|) = \Omega(n) |M| \geq \Omega(n^{1/5})$$

# Volume d = 3

**Thm:** For all  $X \subseteq \mathbb{R}^3$  of size *n*, no four on a plane, there exists Vol-rainbow set of size  $\Omega(n^{\delta})$ . ( $\delta$  TBD) Similar. Left for the reader.

Why is this proof harder?

**KEY** statement about prior proof:

- 1. If INVERSE IMG's are all finite so M is large.
- 2. If INVERSE IMG's are subsets of  $\mathbb{R}^d$  or  $\mathbb{S}^d$  then induct.

Why is this proof harder?

**KEY** statement about prior proof:

1. If INVERSE IMG's are all finite so *M* is large.

2. If INVERSE IMG's are subsets of  $\mathbb{R}^d$  or  $\mathbb{S}^d$  then induct.

**KEY:** We cared about  $X \subseteq \mathbb{R}^d$  but had to work with  $\mathbb{S}^d$  as well. NOW we will have to work with more complicated objects.

- Better Particular Results: e.g., want for all X ⊆ ℝ<sup>2</sup> of size n, there exists a rainbow set of size Ω(n<sup>1/2</sup>).
- 2. General Better Results: e.g., want Let  $1 \le a \le d + 1$ . For all  $X \subseteq \mathbb{R}^d$  of size *n* there exists a rainbow set of size  $\Omega(n^{1/ad})$ .
- 3. Get easier proofs of general theorem.
- 4. Find any nontrivial limits on what we can do. (Trivial:  $n^{1/d}$ ).
